LENGTH: 10 amino acids
TYPE: amino acid
TYPE: anino acid
FRAGMENT TYPE: linear
FRAGMENT TYPE: internal fragment
FRATURE:
OTHER INFORMATION: Xaa in locations 2 to 10 is an
OTHER INFORMATION: amino acid.

Patent No. 5866542

GENERAL INFORMATION:
APPLICANT: George P. Vlasuk, Patric H. Stanssens,
APPLICANT: Joris H.L. Mensens, Marc J. Lauwereys,
APPLICANT: Yves R. Larcche, Laurent S. Jespers,
APPLICANT: Pater W. Bergum
ITILE OF INVENTION: NEMATOBE-EXTRACTED ANTICOAGULANT
ITILE OF INVENTION: PROTEIN
NUMBER OF SEQUENCES: 357

CORRESPONDENCE ADDRESS:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Alitalo K,
                                                                                                                                             Synthetic
 The invention relates to a polypeptide having the ability to bind carcinoembryonic antigen (CEA, an immunoreactive glycoprotein) which is overexpressed in adenocarcinomas of endodermally derived digestive system epithelia and foetal colon. The peptides do not react with non-specific cross-reacting antigen NCA. The peptides, labeled with a radioactive compound, such as indicative of CEA-associated disease and may be subject, which is indicative of CEA-associated disease and may be conjugated with a therapeutic agent such as radioactive or chemotherapeutic agent, toxin or enzyme is useful for treating a CEA associated disease such as colon, lung, breast, cervical, ovarian, stomach, bladder, pancreatic or oesophageal cancer in a subject. The peptides are useful for imaging, localising and targeting tumours exhibiting CEA by radioimaging, magnetic resonance imaging or X-ray imaging. Phage products displaying the peptides are also useful for detection and diagnosis of cancer associated with the expression of CEA in cells and tissues. The present sequence is a representative peptide, or an example of a library, of the CEA binding peptides of the invention
                                                                                                                                        Carcinoembryonic antigen; CEA; non-specific cross-reacting antigen; NCA; adenocarcinoma; cancer; tumour; immunoreactive glycoprotein; indium; technetium; cytostatic; phage display.
                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel carcinoembryonic antigen binding peptides for detecting, imaging, localizing and targeting tumors exhibiting the antigen, especially for treating colon cancer in humans and animals.
                                                                                                                Carcinoembryonic antigen representative binding peptide #3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               100.0%; Score 26; DB 5; Length 10; 100.0%; Pred.                                                                                                                                                                                                                               The present invention describes an isolated peptide (I) that binds to and inhibits vascular endothelial growth factor receptor 3 (VEGFR-3). (I) have cytostatic, hepatotropic, antiinflammatory, hypotensive, antidabetic and vulnerary activities, and can be used in gene therapy. Compositions and methods from the present invention are useful for the cell surface receptor VEGFR-3 such as cancer, e.g. brain, lung, there is spleen, kidney, lymph node, small intestine, blood cells, pancreas, colon, stomach, breast, endometrium, prostate, testicle, ovary, skin, head and neck, oesophagus, bone, marrow or blood, and diseases of neovascularisation, e.g. liver diseases, hypertension, post-trauma, chronic hepatitis, heamangioms and diabetes. The present sequence represents a specifically claimed VEGFR-3 binding peptide from the
New isolated peptide that inhibits VEGF-C and VEGF-D, useful for diagnosing, evaluating, treating disorders mediated by VEGFR-3 activity, such as cancer and diseases of neovascularization.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

RESULT 3

hypergammaglobulinaemia, blood clotting disorders, ischaemia, and neurodegenerative diseases. The present sequence is a B lymphocyte stimulator protein binding peptide

```
The present invention relates to the treatment, prevention or ameliotration of a disease or disorder associated with: aberrant B lymphocyte stimulator (BLyS), BLyS receptor expression or activity; cells of haematopoietic origin; or proliferative disease; and reducing, thinbitting or stimulating immunoglobulin production, Beal proliferation and graft rejection involving administration of BLyS binding polypeptides are used in the treatment, prevention or mealloration of diseases such as immune system diseases, proliferative diseases, diseases of cells of hematopoietic origin, graft rejection; allergies, infectious diseases, arteriosclerosis, inflammatory disorders,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /label≈ Ala, Asn, Arg, Gln, Leu, Met, Ser, Trp, Tyr, Val

                                                                                                                                                                                                                                                               New B-lymphocyte stimulator binding polypeptide useful in detecting or isolating BLyS or BLyS-like polypeptide comprises a specified amino acid
                                                                                                                                                                                                                                                                                                                                                   The invention relates to a B Lymphocyte Stimulator (BLyS) binding polypeptide. BLyS binding peptides bind BLyS or BLyS-like proteins reversibly or irreversibly. The binding peptides are used in detection, isolation and/or purification of BLyS in a solution such as water or a buffer solution, as well as any fluid and/or cell obtained from an individual biological fluid, body tissue, body cell, cell line, tissue culture or other source containing BLyS or BLyS-like polypeptides. Diological fluids include sera, plasma, lymph, blood, blood fraction, urine, synovial fluid, spinal fluid, saliva and mucous. Sequences ABG33406-33415, ABG3423-3555, ABG33588-33846, ABG33848-33850 and ABG33852-33862 represent BLyS binding peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes an interfacial biomaterial (I) comprising binding agents, each having a first ligand that specifically binds a target non-biological substrate and a second ligand that specifically binds a target biological substrate. The binding agents define an
                                                                                            The present invention relates to a new binding agent selective for free prostate-specific antigen (PSA). The invention comprises a peptide at least 6 amino acids long including at least one pair of Cysteine residues separated by at least 2 amino acids and cyclised through a disultide bond or a peptidomimetic having a spatial conformation similar to the peptide. The binding agents of the invention are useful for treating and diagnosing diseases associated with PSA-producing cells, especially benign and malignant prostatic disease. The invention can also be used to isolate and purify various molecular forms of PSA and for targeted delivery of cytocoxic agents, gene therapy vectors and imaging agents of the invention have a binding apecificity that can not be obtained with antibodies. The present amino acid sequence represents the prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   interfacial biomaterial; binding agent; biological substrate; cytostatic;
